This report contains results of analyses performed by DataChem Laboratories, Inc. (DCL) pertaining to the sample(s) referenced above. DCL is AIHA accredited for specified Fields of Testing as documented by the scope of accreditation. The Mycology laboratory manager and analysts hold at least a B.S. degree in Microbiology or equivalent discipline, and are well qualified and experienced with microbial identification.

CASE NARRATIVE

Page: 1 of 2
Date: September 30, 2004

Client: Bechtel Hanford, Inc.
Client Project ID: Not Provided
DCL Project ID: P040X001

DCL Group ID: 04M-0155-02
Method: MC-AN-001
Matrix: Air-O-Cell™

General Set Information: 5 samples were collected on Air-O-Cell™ cassettes and received by DCL for Bioaerosol Spore Analysis using DCL Method MC-AN-001.

Method Summary: DCL Method MC-AN-001 is used to determine fungal spore counts using plain light microscopy under 630x magnification. 100% of the entire sample slide is read. Individual spherical spores lacking any distinguishing characteristics may be grouped and classified under the category "Amerospores." Total fungal spore particulate concentrations include both viable and non-viable counts. The calculated total count is based on the trace length and microscopic field diameter, as recommended and described as correct methodology by the manufacturer of the spore trap cassette. Individual spore counts greater than 400 are based on estimates, due to the higher density rating.

Sample Preparation: The analytical slide is removed from the spore trap cassette and mounted on a supportive glass slide, which is then prepared for viewing by the use of appropriate microbiological stains.

Density Rating: The density rating is based on a visual observation of the non-spore particulate that can mask the presence of fungal spores. Excessive non-spore particulate may make it difficult to produce accurate results and therefore, the following scale is used to assist in the interpretation of the results.

<u>Density Rating</u>	<u>Observation</u>	<u>Interpretation</u>
0	No particulate detected	May indicate improper sampling or blank
1	Minimal particulate present	Analysis is optimal
2	Minor particulate present	Fair analytical conditions
3	Sufficient particulate present	May affect analysis accuracy
4	Abundant particulate present	Analysis may not accurately reflect spore concentration
5	Severely occluded	Sample is not acceptable for analysis

Sample Calculation: Fungal spore concentrations in spores/m³ were determined from the following equation:

$$\frac{\text{Spore Count} \left(\frac{14.4}{\text{Microscopic Field Diameter} \times \text{Number of Transverses}} \right)}{\text{Sample Volume (m}^3\text{)}} = \text{Spore Concentration (spores/m}^3\text{)}$$

Where: *Microscopic Field Diameter* is equal to 0.28 mm under 630x magnification; and
Number of Transverses at 630x magnification has been determined at an average of 48 fields.

Health Effects: Although certain molds and fungi have been documented in association with allergenic or pathogenic properties, DCL makes no representation as to whether any one specific organism that may be present in the sample(s) analyzed by DCL is harmful to humans or animals.
